Install the Development App on Your Android Phone

For the project team only. This is a **development build** (name on the phone: "MedLuma (DEV)" — the name is a temporary placeholder). It is an evaluation prototype, not clinically validated, and must not be shared with anyone else. You do **not** need to build anything.

No Android phone? See `docs/TEST_ON_COMPUTER.md` (Mac or Windows laptop, Android Emulator).

Which file to install

Every build has a version and a build number. The build number goes up with every APK; a higher build installs over a lower one.

Build	Version shown in the app	File	Size	SHA-256	Status
9 (current)	0.1.8-dev (build 9)	`medluma-dev-v0.1.8-b9-arm64-v8a.apk` — **use this one first**	33.3 MB	`be575247ac8b3e90f6893e04b1c3431e86fda6a94e22e3fb3389cb398883241a`	Recommended; test with `docs/task4c/PIXEL_SCAN_TEST_GUIDE.md`
9	0.1.8-dev (build 9)	`medluma-dev-v0.1.8-b9-universal.apk`	71.2 MB	`d2481cc0a01064ee1f4236363b45df06fb84030c4f06a40b0f38bc6f5dc1d3fc`	Fallback
8	0.1.7-dev (build 8)	`medluma-dev-v0.1.7-b8-arm64-v8a.apk`	33.3 MB	`9bbf1f6c59c1b8ed2cdbfa74effbc83f31eb54ecbb62d4d48d894c0016e5ab0b`	Superseded (banner wording only)
7	0.1.6-dev (build 7)	`medluma-dev-v0.1.6-b7-arm64-v8a.apk`	41.4 MB	`c0b44b6ba2ff3d7b57891faf822f199ff2c82d24034797d286c0b3ece54b6d73`	Superseded (same app, larger)
6	0.1.5-dev (build 6)	`medluma-dev-v0.1.5-b6-arm64-v8a.apk`	41.4 MB	`4873b40d497dc10f30ec0ddf51b99778f0a872961da8c4dd9cacccc65fff82a6`	Superseded (scanning worked on the Pixel; long result list)
5	0.1.4-dev (build 5)	`medluma-dev-v0.1.4-b5-arm64-v8a.apk`	38.9 MB	`9972d0368bae90832c23048ef897818a96d78d6bb37a319ea886bb133b49835f`	Superseded (text reading returned nothing on the Pixel)
4	0.1.3-dev (build 4)	`medluma-dev-v0.1.3-b4-arm64-v8a.apk`	38.9 MB	`629a7035a63044f0611362ef764f283529084deffb9af8b62f03186c77d4d958`	Superseded (every scan failed on the Pixel)
3	0.1.2-dev (build 3)	`medluma-dev-v0.1.2-b3-arm64-v8a.apk`	15.2 MB	`31023c94b47ac50326411c5462a9838ab5b3ead5845d0f06ac00cc618d2cbb7e`	Superseded (no scanner)
3	0.1.2-dev (build 3)	`medluma-dev-v0.1.2-b3-universal.apk`	29.6 MB	`8dedb5e7226d41de3dba326f5bb7fa2f8ca800ec6e83292863784eca297481de`	Superseded

Build	Version shown in the app	File	Size	SHA-256	Status
2 (already sent)	0.1.0 (no build number shown)	`medluma-dev-0.1.0-task4a1.apk`	63.5 MB	`0718180fb5a107c0fb99bf6cc2ffde256c1b9a81a35b9380f44fe97bec2b3907`	Superseded; see "Installing the already-available build"
1	0.1.0	`app-dev-release.apk` ("Rx Recall Check (DEV)")	63.5 MB	`648e9c07b4598ea570d22cefd11c5b9ff983bc56392cfb16f6ad9748fa00de11`	Superseded

The ARM64 file works on almost every Android phone made since about 2017. The universal file works on older 32-bit phones too; it is larger but otherwise identical.

Option A — easiest: download directly on the phone

1. On the phone, open the **Claude app** (or claude.ai in Chrome) and open this conversation.
2. Tap the file card **`medluma-dev-v0.1.8-b9-arm64-v8a.apk`** and download it.
3. Continue at **"Install"** below.

Checking the checksum on the phone needs an extra app, so if you want to verify it, use Option B.

Option B — with your MacBook Pro (lets you verify the checksum)

1. Download on the Mac

Open this conversation on claude.ai in a browser on the Mac and download the file card. It goes to your **Downloads** folder.

2. Verify the checksum

Open **Terminal** (Applications → Utilities → Terminal) and run:

```
shasum -a 256 ~/Downloads/medluma-dev-v0.1.8-b9-arm64-v8a.apk
```

The long code printed must be exactly the SHA-256 in the table above. If it is different, delete the file and download it again; do not install a file whose checksum does not match.

3. Move it to the phone (pick one)

- **Google Drive:** drag the file into drive.google.com on the Mac, then open the Drive app on the phone and download it. (The APK contains no personal data.)
- **USB cable with adb** (most reliable, also used for diagnostics):

    1. Install Homebrew if you do not have it (https://brew.sh), then install Android's tools:

        ```
        brew install --cask android-platform-tools
        ```

2. On the phone: **Settings → About phone →** tap **Build number** seven times (it says "You are now a developer"). Then **Settings → System → Developer options →** turn on **USB debugging**. (On Samsung: Settings → About phone → Software information → Build number.)

3. Connect the phone to the Mac with a USB cable. On the phone, tap **Allow** on "Allow USB debugging?". Check the Mac sees it:

   ```
   adb devices
   ```

   It should list one device ending in `device` (not `unauthorized`).

4. Install directly (skip the "Install" section below):

   ```
   adb install -r ~/Downloads/medluma-dev-v0.1.8-b9-arm64-v8a.apk
   ```

   `Success` means it is installed.

Install (Options A and Google Drive)

1. Open the **Files** app (or **My Files** on Samsung) → **Downloads** → tap the APK.
2. Android asks to allow installs from this source: tap **Settings**, turn on **Allow from this source**, then go back.
3. Tap **Install**. Google Play Protect may warn that the app is from an unknown developer — this is expected for an unpublished development build. Choose **Install anyway** (only because you got it from this conversation and, ideally, verified the checksum).
4. Afterwards, turn **Allow from this source** back off for that app.

If it says "App not installed" or `INSTALL_FAILED_NO_MATCHING_ABIS`: your phone needs the universal file — install `medluma-dev-v0.1.2-b3-universal.apk` instead. **If it says `INSTALL_FAILED_UPDATE_INCOMPATIBLE`** or "package conflicts with an existing package": an older copy signed differently is installed. Uninstall "MedLuma (DEV)" / "Rx Recall Check (DEV)" first, then install again.

Launch and check the version

1. Open **MedLuma (DEV)** from the app drawer. No computer or other setup is needed; the phone needs internet for lookups.
2. A purple banner says **DEVELOPMENT BUILD — evaluation prototype…** on every screen.
3. Read "Before you start" and tap **I understand** (it appears at every launch in this build, because the development build saves nothing).
4. Tap **About and privacy**: it should say **version 0.1.8 (build 9)**. If it does not show a build number, you are running an older build.

Then follow the test plan: `docs/FUNCTIONAL_TEST_PLAN.md` (use only the test medications listed there, never your own medication details).

Older builds

A newer build installs over any older one. To go back to an older build, uninstall first.

If something goes wrong: report it without personal data

Only report from sessions where you used the test medications in `docs/FUNCTIONAL_TEST_PLAN.md`.

1. **Write down** the test number (e.g. F-07), what you did and what the screen said.
2. **Screenshot** the screen (Power + Volume down). Screenshots of test medications are fine.
3. **App version:** About and privacy → the version line.
4. **Phone model and Android version:** Settings → About phone.
5. **If the app closed by itself (crash)** and you have the Mac + adb set up:

   ```
   adb logcat -b crash -d > ~/Desktop/medluma-crash.txt
   ```

   This saves only crash reports (the app does not log medication details). Check the file before sending it.

Do **not** send: a full `adb logcat` without `-b crash`, an Android "bug report" (contains personal device data), or screenshots showing your real medications.

Uninstall

Long-press the app icon → **Uninstall**, or:

```
adb uninstall org.rxrecallcheck.app.dev
```

This removes the app and everything it stored.
